

Globaltherm®
a TF Warren Company

Your engineered thermal system provider

Globaltherm completed a terminal expansion project in Oklahoma for an owner who needed to store asphalt. The project required insulating nine asphalt storage tanks.

The scope of work included:

- Project management, design, manufacture and field installation of the custom composite insulation panel system for the nine (9) asphalt storage tanks.
- Insulation consisting of 3" thick fiberglass and 1.5" thick Polyisocyanurate for a total of 4.5" thick insulation. The insulation thickness was based on tanks operating temperature of 350 F.

Globaltherm used suspended scaffolding to gain access to install the insulation as the area could not be accessed with manlifts.

Globaltherm provides insulation systems for tanks storing various products in terminals, refineries, petrochemical facilities, utilities and wastewater plants, power generation facilities, fire protection applications, and for food and beverage storage. For more information contact us.
